

Crane Safety Load Measurement

Crane Load - We provide load-measuring transducers to measure load forces on the crane structure and if telemetry applications are required we can provide the remote signalling, displays and alarms.

Active Load have a very wide knowledge of load measurement for many most crane applications.

The load pins are designed to replace existing pivot pins. Where necessary the load pins have to be strain

gauged with two independent strain gauge bridges.

We are able to supply load pins with multi-axis load direction load pins that can be used to calculate the resultant force.
